PROFESSIONAL SUMMARY

Full-Stack Developer with 8 years of experience building scalable, resilient backend systems in cloud-native, test-driven environments. Specialize in Java, Spring Boot, AWS, microservices, Ember.js, distributed systems and Kafka event-driven architecture, with delivery in Payment Systems, Margin Trading, Observability, and CI/CD.

SKILLS SUMMARY

- **Languages & Frameworks:** Java 8, Java 21, Spring Boot, Spring Core, JPA, Spring JDBC, GraalVM Native Image, GWT, Angular, Ember.js, Node.js.
- **Cloud & AWS:** IAM, VPC, Subnets, Security Groups, API Gateway, Lambda, ECS, DynamoDB, S3, SQS, DLQ, EventBridge, Route 53, ALB, Direct Connect, Secrets Manager, Parameter Store, CloudWatch (Logs, Insights, Alarms).
- **DevOps & IaC:** Infrastructure as Code (Terraform), GitLab CI/CD, Bamboo, Nomad, Docker (Jib), HashiCorp Vault, Maven, Snyk, Rocky 9 / Linux.
- **Messaging & Streaming:** Apache Kafka, ActiveMQ (AMQ), FMQ to AMQ migration.
- **Observability:** Grafana, Prometheus, Splunk, Honeycomb, PagerDuty, distributed tracing, metrics, dashboards, alerting.
- **Testing & APIs:** JUnit, Mockito, Postman, Swagger, REST, Feign Client.
- **Databases:** SQL, DynamoDB, MySQL, Oracle.
- **Tools & Practices:** Agile/Scrum, Jira, GitLab, Bitbucket, IntelliJ, VS Code, CyberArk, PRET, PuTTY.
- **AI-Assisted Engineering:** Claude Code, MCP, RAG, Skills, and Agents for productivity and workflow automation.

PROFESSIONAL EXPERIENCE

IG Group — Full Stack Java Developer — Jun 2022 – Present

APAC Payments: Payment-processing platform powering BJP bank deposits, where customers fund trading accounts through Japanese banks and IG records the authorization.
MTF Issuer: IG's regulated Multilateral Trading Facility for exchange-traded turbo warrants, managing the full warrant lifecycle.

Cloud Architecture & AWS Migration

- Defined the scope for an on-premises-to-AWS cloud migration, measured by a complete inventory of external API calls and database read/write consumers, by leading dependency analysis across services before designing a scalable, secure AWS cloud architecture for data sourcing.
- Launched customer-facing deposit APIs for the Japan bank-deposit journey, measured by cold starts under 5 seconds, by building Spring Boot services on AWS Lambda (GraalVM native) behind API Gateway for configuration, initiation, and bank redirect/callback flows.
- Built on-premises-to-AWS connectivity via Kafka mirroring using compacted topics to reliably sync 300+ million records, publishing events through EventBridge, consuming via SQS, and persisting to DynamoDB — masking PII sensitive data, handling secrets securely, and designing for failover and reliable retries with a DLQ.
- Enabled scan-free querying and valid payment state transitions, measured by single-digit-millisecond reads, by designing a scalable, cost-effective DynamoDB (NoSQL) data model with Global Secondary Indexes (GSIs) and conditional writes.
- Reduced authorization latency to single-digit milliseconds on cache hits and cut authorizer invocations by up to 90%, by designing a cost-effective JWT Lambda Authorizer that validates RS256 tokens over Direct Connect, using in-memory JWKS caching and API Gateway response cache.
- Built an SQS-based enrichment pipeline with backfill support, eliminated a data-loss defect from null/blank updates overwriting protected fields, with acceptance tests to prevent regression.
- Provisioned Lambda, API Gateway, DynamoDB, and SQS consistently across 3 environments (dev, UAT, prod), measured by zero manual console changes, by codifying all resources as Infrastructure as Code (IaC) with Terraform.
- Cleared 100% of Critical/High security vulnerabilities across 5+ services, by remediating Snyk findings and establishing a risk-acceptance policy for Medium/Low issues.

DevOps & Platform Migration

- Independently delivered the end-to-end migration of a legacy Spring/Tomcat application to Nomad, by migrating it to a shared backend node pool and updating environment CNAMEs to resolve datacentre-flip issues.
- Standardised deployments across 3 environments, measured by deployment time reduced from 1 hour of manual steps to 15 minutes automated, by containerising services with Jib and designing GitLab CI DevOps pipelines for native Nomad releases.
- Migrated 20+ secrets and config to HashiCorp Vault — injecting datasource, messaging, storage, and SSO credentials via Vault templates — removing credentials from on-prem config files.
- Migrated 100% of production traffic to Nomad, measured by zero-downtime cutover, by using feature-flag routing for a controlled rollout.

Microservices & Event-Driven Systems

- Enabled independent deployment of 10+ Spring Boot microservices, measured by per-service releases with no cross-team release coordination, by defining clear service boundaries and stable REST API contracts.
- Delivered reliable, high-throughput messaging across 5+ services, measured by millions of events processed daily with zero message loss, by building SSL/SASL-secured Kafka producers and consumers with tuned consumer groups and schema-based serialisation.
- Restored a stalled Kafka consumer pipeline, measured by consumer lag cleared to zero, by root-causing a Kafka library incompatibility, a truststore misconfiguration, and a listener type mismatch.

Observability

- Shortened mean-time-to-detect on payment incidents, by building alarm services that ship CloudWatch logs and metrics to Honeycomb, with PagerDuty alerting and Teams notifications.
- Improved system-health visibility across 5+ services, measured by production diagnosis, by instrumenting structured logging, Prometheus metrics, and distributed tracing, and building Grafana dashboards for key business flows.

Technical Leadership & Process Improvement

- Acted as SME for the Japan Payments AWS platform, measured by architecture decisions adopted across 3 teams (payments, network, platform), by authoring architecture decision records, including the JWT Authorizer ADR, and aligning cross-functional decisions.
- Drove adoption of AI-assisted engineering, integrating Claude Code, Retrieval-Augmented Generation (RAG), Model Context Protocol (MCP), Skills, and Agents into day-to-day development workflows.
- Boosted engineering productivity by automating routine tasks and accelerating code, documentation, and investigation work.

Atos Syntel | Java Developer **Oct 2018 – Jun 2022**

- Designed and developed web applications and RESTful microservices across data-governance, trade/tariff, and invoice processing workflows, spanning backend services and Azure cloud-hosted deployments.
- Managed release cycles, onsite/offshore coordination, and client interaction in a test-driven environment, and resolved production defects.
- **World-Tariff Editor Rebuild:** Microservices application maintaining taxes and trade agreements across countries, built with Eureka, Spring Boot, REST APIs, JPA, and SQL using TDD.
- **Bill of Lading:** Web application that reads XML and JPG files from an Azure container, parses XML to JSON, and displays invoice details; backend built with Spring Boot, REST APIs, JPA, and MySQL.
- **Data Governance Framework:** Web application maintaining metadata to catalogue data by owner, source, and category, hosted on a PaaS platform; built with Java, GWT, and JDBC.

EDUCATION

B.E. in Computer Science | Gogte Institute of Technology, VTU **2014 – 2018**
